**Problem Statement** : Prepare a small app which displays images and videos in a slider/ Horizontal list.

**You must**:
1. Fetch the data from attached json file which contains images and Videos in form of URLs.
2. Show images and videos using same slider/horizontal list component.
3. Video should start when video slide is visible to user and stop/pause when user swipes to next/previous slide.
3. Submit your work via Github / Bitbucket / Gitlab. Share access to prabhu.d@bewakoof.com

**Note**:
1. Architectural choices. The goal is to get the app done quickly, but we do want to see if your code would be easy to build upon.
2. Knowledge of Design guidelines - whether you use appropriate paddings, margins and type sizes
3. Use of third party libraries. This is highly encouraged, use whichever libraries you know of that help you get your work done faster.
